Contents

Preliminaries ........................................................................................................ P-1

Part I Linear Algebra

Basic Linear Algebra

1 Vectors, Matrices and Systems of Linear Equations
   Jane Day ................................................................. 1-1

2 Linear Independence, Span, and Bases
   Mark Mills ............................................................. 2-1

3 Linear Transformations
   Francesco Barioli ................................................. 3-1

4 Determinants and Eigenvalues
   Luz M. DeAlba .................................................... 4-1

5 Inner Product Spaces, Orthogonal Projection, Least Squares
   and Singular Value Decomposition
   Lixing Han and Michael Neumann ....................... 5-1

Matrices with Special Properties

6 Canonical Forms
   Leslie Hogben .................................................... 6-1

7 Unitary Similarity, Normal Matrices and Spectral Theory
   Helene Shapiro .................................................... 7-1

8 Hermitian and Positive Definite Matrices
   Wayne Barrett ..................................................... 8-1

9 Nonnegative and Stochastic Matrices
   Uriel G. Rothblum ................................................ 9-1

26 Matrices Leaving a Cone Invariant
   Bit-Shun Tam and Hans Schneider .............................................. 26-1

Part II Combinatorial Matrix Theory and Graphs

Matrices and Graphs
27 Combinatorial Matrix Theory
   Richard A. Brualdi ................................................................. 27-1
28 Matrices and Graphs
   Willem H. Haemers ............................................................... 28-1
29 Digraphs and Matrices
   Jeffrey L. Stuart ................................................................. 29-1
30 Bipartite Graphs and Matrices
   Bryan L. Shader ................................................................. 30-1

Topics in Combinatorial Matrix Theory
31 Permanents
   Ian M. Wanless ................................................................. 31-1
32 D-Optimal Designs
   Michael G. Neubauer and William Watkins ............................ 32-1
33 Sign Pattern Matrices
   Frank J. Hall and Zhongshan Li ........................................... 33-1
34 Multiplicity Lists for the Eigenvalues of Symmetric Matrices
   with a Given Graph
   Charles R. Johnson, António Leal Duarte, and Carlos M. Saiago 34-1
35 Matrix Completion Problems
   Leslie Hogben and Amy Wangsness ...................................... 35-1
36 Algebraic Connectivity
   Steve Kirkland ................................................................. 36-1

Part III Numerical Methods

Numerical Methods for Linear Systems
37 Vector and Matrix Norms, Error Analysis, Efficiency and Stability
   Ralph Byers and Biswa Nath Datta ........................................ 37-1
38 Matrix Factorizations, and Direct Solution of Linear Systems
   Christopher Beattie ............................................................ 38-1
39 Least Squares Solution of Linear Systems
Per Christian Hansen and Hans Bruun Nielsen ..................................................... 39-1

40 Sparse Matrix Methods
Esmond G. Ng ................................................................................................. 40-1

41 Iterative Solution Methods for Linear Systems
Anne Greenbaum ............................................................................................. 41-1

Numerical Methods for Eigenvalues

42 Symmetric Matrix Eigenvalue Techniques
Ivan Slapničar ..................................................................................................... 42-1

43 Unsymmetric Matrix Eigenvalue Techniques
David S. Watkins ............................................................................................... 43-1

44 The Implicitly Restarted Arnoldi Method
D. C. Sorensen .................................................................................................... 44-1

45 Computation of the Singular Value Decomposition
Alan Kaylor Cline and Inderjit S. Dhillon ......................................................... 45-1

46 Computing Eigenvalues and Singular Values to High Relative Accuracy
Zlatko Drmač ....................................................................................................... 46-1

Computational Linear Algebra

47 Fast Matrix Multiplication
Dario A. Bini ........................................................................................................ 47-1

48 Structured Matrix Computations
Michael Ng ........................................................................................................... 48-1

49 Large-Scale Matrix Computations
Roland W. Freund ............................................................................................... 49-1

Part IV Applications

Applications to Optimization

50 Linear Programming
Leonid N. Vaserstein ........................................................................................ 50-1

51 Semidefinite Programming
Henry Wolkowicz ............................................................................................... 51-1

xviii
Applications to Probability and Statistics
52 Random Vectors and Linear Statistical Models
  Simo Puntanen and George P. H. Styan ................................................... 52-1
53 Multivariate Statistical Analysis
  Simo Puntanen, George A. F. Seber, and George P. H. Styan ..................... 53-1
54 Markov Chains
  Beatrice Meini ............................................................... 54-1

Applications to Analysis
55 Differential Equations and Stability
  Volker Mehrmann and Tatjana Stykel ................................................... 55-1
56 Dynamical Systems and Linear Algebra
  Fritz Colonius and Wolfgang Kliemann ................................................ 56-1
57 Control Theory
  Peter Benner ................................................................. 57-1
58 Fourier Analysis
  Kenneth Howell .............................................................. 58-1

Applications to Physical and Biological Sciences
59 Linear Algebra and Mathematical Physics
  Lorenzo Sadun ................................................................. 59-1
60 Linear Algebra in Biomolecular Modeling
  Zhijun Wu ................................................................. 60-1

Applications to Computer Science
61 Coding Theory
  Joachim Rosenthal and Paul Weiner ............................................. 61-1
62 Quantum Computation
  Zijian Diao .................................................................. 62-1
63 Information Retrieval and Web Search
  Amy Langville and Carl Meyer .................................................. 63-1
64 Signal Processing
  Michael Stewart ............................................................ 64-1

Applications to Geometry
65 Geometry
  Mark Hunacek ............................................................... 65-1
Some Applications of Matrices and Graphs in Euclidean Geometry
*Miroslav Fiedler*

Applications to Algebra

Matrix Groups
*Peter J. Cameron*

Group Representations
*Randall Holmes and T. Y. Tam*

Nonassociative Algebras
*Murray R. Bremner, Lucia I. Muakami and Ivan P. Shestakov*

Lie Algebras
*Robert Wilson*

Part V  Computational Software

Interactive Software for Linear Algebra

MATLAB
*Steven J. Leon*

Linear Algebra in Maple
*David J. Jeffrey and Robert M. Corless*

Mathematica
*Heikki Ruskeepää*

Packages of Subroutines for Linear Algebra

BLAS
*Jack Dongarra, Victor Eijkhout, and Julien Langou*

LAPACK
*Zhaojun Bai, James Demmel, Jack Dongarra, Julien Langou, and Jenny Wang*

Use of ARPACK and EIGS
*D. C. Sorensen*

Summary of Software for Linear Algebra Freely Available on the Web
*Jack Dongarra, Victor Eijkhout, and Julien Langou*
