Chapter 6.1 - Eulerian Graphs

Historical problem: Take a walk in Königsberg and traverse every bridge exactly once. Bridges are black.

1: Is it possible to traverse every bridge exactly once?

Recall that trail is a sequence of vertices and edges without repeating edges. Circuit is a closed trial. A graph is Eulerian if it contains a circuit that contains all edges. Such circuit is called Eulerian circuit.

2: Find Eulerian circuit in the following graph

3: Decide if $K_5$ and the Petersen’s graph are Eulerian.

4: Show that if $G$ is Eulerian, then degree of every vertex is even.

Theorem 6.1 A nontrivial connected graph $G$ is Eulerian if and only if every vertex of $G$ has even degree.

5: Show that if a connected graph $G$ has every vertex of even degree, then $G$ is Eulerian. (Hint: Take longest circuit)

Eulerian trail in a graph $G$ is a trail in $G$ containing all edges and does not start and end at the same vertex.

6: Find an Eulerian trail in the following graph
Corollary 6.2 A connected graph $G$ contains an Eulerian trail if and only if exactly two vertices of $G$ have odd degree. Furthermore, each Eulerian trail of $G$ begins at one of these odd vertices and ends at the other.

8: Does every Eulerian bipartite graph have an even number of edges? Explain.

9: Does every Eulerian simple graph with an even number of vertices have an even number of edges? Explain.

10: Prove or disprove the following statement: If $G$ is a graph with edges $e$ and $f$ that share a common vertex $v$, then there is an Eulerian circuit which goes through the edge $e$ and then immediately after through $f$.

11: Only one graph of order 5 has the property that the addition of any edge produces an Eulerian graph. What is it?

12: Notice that the Eulerian graph can be defined also for directed graphs. Show that a directed graph $G$ is Eulerian if and only if the graph is connected and at each vertex the in-degree equals the out-degree.

13: Prove that if $P$ and $Q$ are paths of maximum length in a connected graph $G$, then $P$ and $Q$ have at least one vertex in common.

14: Open problem In a connected graph, pick any three paths of maximum length. Is there always a vertex that lies on all of them?
